

Start a report from scratch

Create workspace → upload sources → create document → ask AI → insert a citation

about 10 minutes, no setup

1 Create workspace

Name it, pick an accent. People are invited after, not before.

2 Upload sources

Drop PDFs and data. Each file walks Uploaded → Processing → Ready.

3 Create a document

Start from a laboratory-report structure or a blank page.

4 Ask AI

Scope is visible. Every claim carries a citation chip.

5 Insert a citation

Source, page and quote travel with the sentence. Provenance is recorded.

From a spreadsheet to a reproducible figure

Open dataset → describe analysis → run → inspect provenance → insert chart into document

the chart draws itself

1 Open the dataset

Sheet, columns and a warning about text in number columns.

2 Describe the analysis

Plain language, plus the columns you pick. No code to write.

3 Run

Four friendly steps. You can leave and get notified.

4 Inspect provenance

File → sheet → columns → request → code → run → result → chart.

5 Insert chart

Chart + caption, source reference, analysis link. Marked out of date if data changes.

failure path: plain reason, quick fixes, run again

no stack traces, no infrastructure words

Back a claim with evidence

Select claim → find evidence → inspect source → add citation

check it before you cite it

1 Select the claim

Highlight a sentence, choose “Find evidence” in the selection toolbar.

2 Find evidence

Strong support and possible contradiction side by side. Strength is described, not scored.

3 Inspect the source

Open the page, read the passage in context, save it as evidence.

4 Add the citation

[1] links to source and page. The paragraph's provenance updates.

no evidence → mark as open question contradicting evidence is information, not an error

From comparison to a careful synthesis

Compare sources → detect contradiction → insert synthesis into the report

disagreement is data

1 Compare sources

Question, method, dataset, finding and limits in one grid — each cell cited.

warm yellow and coral, gently — never “AI error”

2 Detect the contradiction

Supporting and qualifying evidence, and why they differ: range, architecture, method.

3 Insert the synthesis

The wording arrives as a suggestion. Insert, edit or discard — your text never changes silently.

4 Provenance keeps the trail

Who inserted it, from which sources, and every earlier version to return to.

export the comparison as a table
